INTRODUCTION

PORTFOLIO

Scope of the document:

Welcome to my personal portfolio website!

This website is a reflection of my journey, my passion, and my commitment to frontend development. It's a virtual canvas where I showcase my work, share my experiences, and connect with individuals who appreciate creativity and innovation.

As a web developer, “I've had the privilege of working on a wide range of projects, from building interactive e-commerce websites to developing custom web applications for businesses, which have not only sharpened my coding skills but also enhanced the user experience and functionality of various online platforms". This website is a testament to the countless hours of dedication, learning, and exploration that have brought me to where I am today.

Through these digital pages, you'll find a curate selection of my projects, each representing a piece of my creative vision and expertise. From designing responsive and user-friendly interfaces to optimizing website performance and implementing robust security measures, my work showcases a holistic approach to web development that emphasizes both aesthetics and functionality; I've poured my heart and soul into every endeavour.

I've designed this website not only to showcase my work but also to connect with like-minded individuals, potential collaborators, and anyone who shares a passion for frontend design. Whether you're here to explore my portfolio, discuss a potential project, or simply get in touch, I'm thrilled to have you as a visitor.

Thank you for taking the time to explore my online space. I hope you find inspiration within these virtual walls, and I look forward to the possibility of collaborating and creating something incredible together.

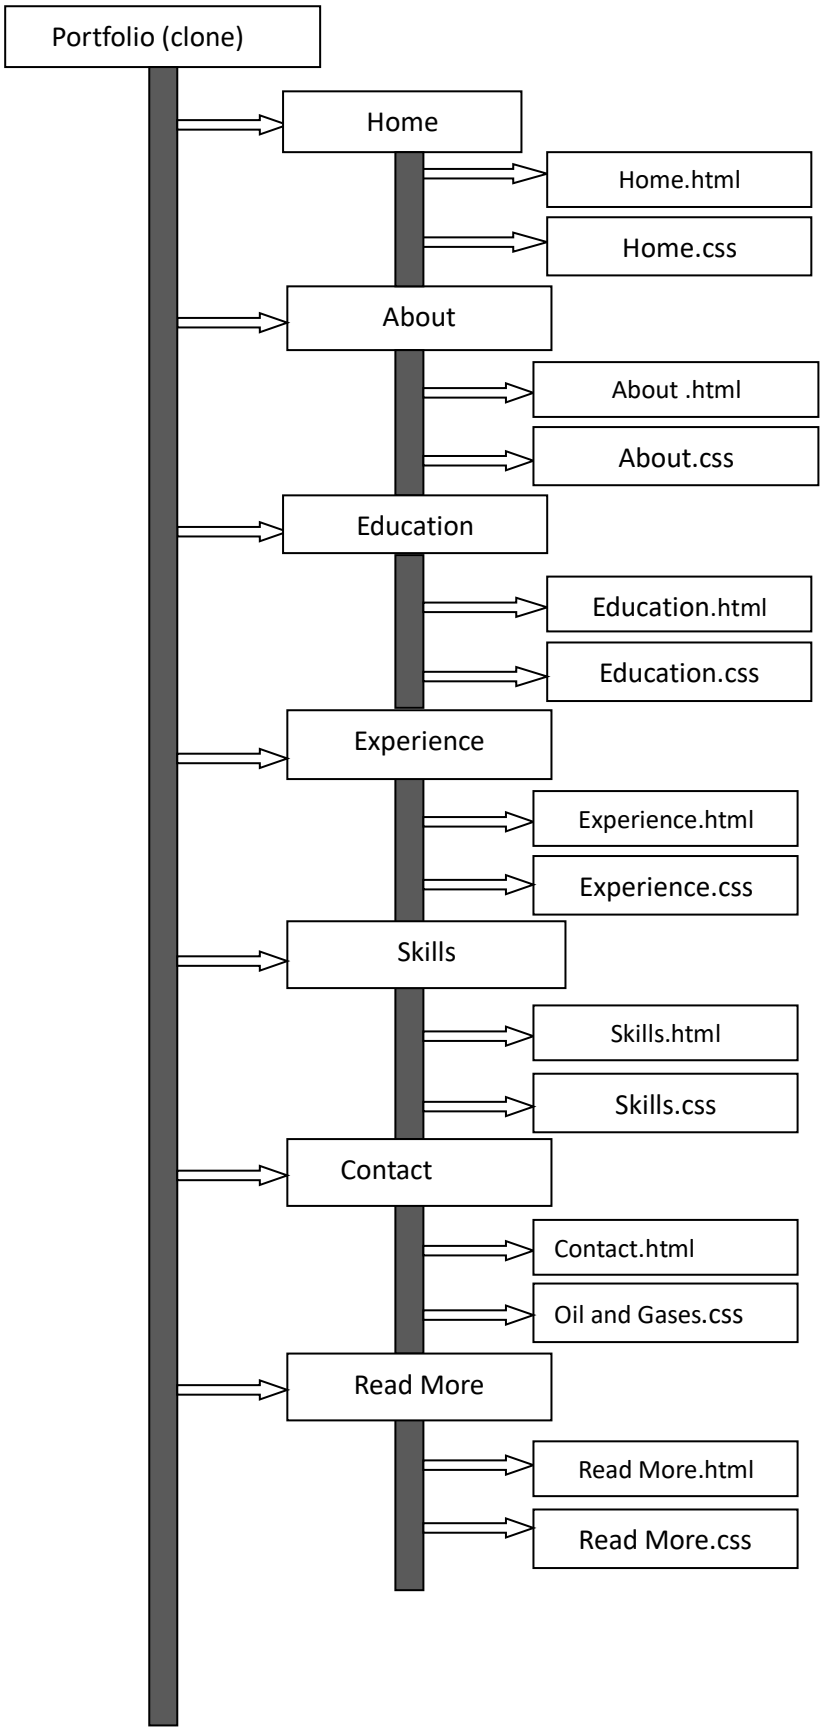
→ALL THE CORRESPONDING SCREENSHOTS OF PAGES

FILE HIERARCHY DIAGRAM



HISTORY OF HTML:

HTML stands for **Hyper Text Markup Language**.

- It is used to share the information over the internet.
- HTML id developed by Tim Berner's Lee in 1991.But officially in 1993.
- The First version of HTML consists of "18 tags"
- HTML follows certain rules and regulations setup by "**ISO**".
- International Organization for standardization is set of rules and regulation are present in '**SGML**' document.

Versions of HTML

- **HTML-1** version in the year 1993.
- **Html-2** version in the year 1995.
- **HTML-3.02** version in the year 1997.
- **HTML-4.1** version in the year 1999.
- **HTML-5** version in the year 2014.

Features of HTML

- It is easy to Learn.
- It is a tag based language.
- HTML is supported by multiple browsers.
- First web browser is Netscape navigation which was developed by the "Mosiac".
- It is a portable language.
- **WORA** stands for 'write once run anywhere'

Limitation of HTML

- HTML has less designing capabilities.
- It is dependent on other technology such as CSS in order to develop well designed Webpages.
- HTML has no programming capabilities.

- Using HTML and CSS we can develop only static Web page. In order to write the HTML code required an editor such as VS Code, Notepad, Eclipse.
- In order to execute the HTML code we required Web browsers.Like Chrome, Firefox, edge, Opera Safari .

CSS

- **CSS** stands for Cascading Style Sheets.
- It was developed by W3C to add stylings to the HTML elements.
- W3C stands for World Wide Web.com

Versions of CSS:

- **CSS-1** (level-1) in the year 1996.
- **CSS-2** (level-2) in the year 1998.
- **CSS-3** (level-3) in the year 1999.

Why do we require CSS?

- Since HTML has less designing capabilities we cannot create well designed or most appealing Websites.
- Using HTML we cannot add style, animation and transitions to the Webpage.
- Therefore we require CSS to create well designed WebPages.

Advantages of CSS

- It allows to add styles, animation and various effects to the Webpage.
- It allows us to develop the Webpage rapidly. It is also know as RAD (rapid application Developer).
- It allows us to separate from formatting develop page to the presentation of Webpage.
- It allows to create well designed Websites.

Limitations of CSS

- Using CSS we can perform static styles for the WebPages.
- In order to create dynamic styling for the Websites. We must make use of scripting language such as JavaScript and Libraries of JavaScript.

Types of CSS:

1. Inline CSS
2. Internal CSS

3. External CSS
4. Default Browser CSS

Inline CSS:

Defining all the CSS properties within the style attribute inside the opening of the tag is referred to as Inline CSS.

Internal CSS:

Defining all the CSS properties within <style> inside the HTML document is referred to as Internal CSS.

External CSS:

Defining all the CSS properties within as external Script or File with an extension CSS is referred to as External CSS.

- In order to link external CSS file within the HTML document we must use of <link>.
- The value for the ‘ref’ attribute should be ‘style sheet’.

Conclusion

In conclusion, the development of a portfolio using only HTML and CSS demonstrates the power of simplicity and the skilful utilization of fundamental web technologies. This project

exemplifies the effectiveness of clean and well-structured code to replicate the core features and design of the original website.

By leveraging HTML for structuring content and CSS for styling, we have achieved a faithful representation of the portfolio and layout. This approach underscores the importance of attention to detail in design and the mastery of these fundamental web technologies.

In summary, the successful creation of a portofolio using only HTML and CSS showcases the importance of these foundational technologies in web development and their capability to replicate a website's design and layout with precision.
